

b) Within the automotive industry there are many waste products & materials many of ~~which~~ which are ~~the~~ hazardous & it is important that they are ~~exposed~~ of correctly. Waste products such as steel & other metals can be sold or ~~to~~ given to recycling plants where they will be re-used. Other waste products such as oil filters can not be sold directly to recycling plants but stored in a drum that is correctly labeled in a bund area. This is to ensure that if there is still oil on the filters it will not get into any storm water drains, full filters should be stored in a similar manner.

as of the oil filters.

Hazardous materials & chemicals can cause a drastic affect on both the handler & the environment if not handled correctly. Chemicals such as fuel, oil & coolant should be stored in original containers in a well ventilated bund area in case of spillage. Used oil & coolant should be stored in a similar manner but in large 55d drums, correctly labeled, ~~location~~ in a cool, dry, well ventilated ^{large} area. This will ensure that the hazardous materials will cause ^{or little} no environmental threat if there is a leak. The drums will be stored until ~~the~~ an environmental protection agency or government equated person recovers the drums from the work site.

Noise is a environmental issue that is hard to over come. There is however ways of reducing noise pollution & that is by a number of different ways. The first is by operating loud equipment between surtain times of the day, another is to ~~to~~ open up all doors & windows in stead of using the exhaust extractors. It is important that the issue of noise pollution is to be over come but due to exhaust gasses being highly toxic & poisonous to people it is hard to have an open but yet quite work space.
