

**Marks**

**Question 19 (continued)**

The answers marked incorrect on page 19 are the processes which can remove the components that may be found in water extracted from the lake.

Mark 100% of the five processes and explain how the process reduces the risk of infection from pathogens.

- ... ~~filtration~~ ... filter out large particles such as sediment, silt, pathogens
- ... ~~chlorination~~ ... through chlorine that inactivates
- ... large particles including some viruses. Disinfecting
- ... ~~water~~ ... of the water system is chlorination.
- ... ~~the~~ ... water treatment, it ... ~~water~~ ...
- ... water is specific and ~~infectious~~ ... ~~water~~ ...
- ... is ~~removed~~ ... ~~water~~ ...
- ... pathogens, and ~~harmful~~ ... ~~water~~ ...
- ... ~~water~~ ... ~~water~~ ...

**Question 20 (4 marks)**

Outline how mitosis and cell differentiation assist in the maintenance of health.

4

Mitosis, which is the replication of cells and cell differentiation which is when cells become specialised and have specific functions, assist the body in the maintenance of health. Without mitosis, there would not be enough cells in the body to carry out specialised roles. ~~Therefore~~, after mitosis, cell differentiation occurs, and this is important as many cells have their own ways of fighting off diseases and maintaining the body's health. For example, white blood cells are important in the second and third line of defence and help to engulf antigens and destroy them. Mitosis is also important because if some cells ~~are~~ become mutated and die (eg cancer cells), mitosis can produce new, healthy cells and <sup>are mutations</sup> therefore the maintenance of health can continue.
