

Two ecosystems at risk that I know of and have studied is Palau and Antarctica.

Palau is the worst affected due to a number of activities that take place there. There has been nuclear activity occurring in Palau from America and Japan. Also with the number of ships and boats running through it it causes major damage to the whole area including the wildlife. Palau is a very poor island where the people find it hard to live and with the pollution it doesn't make it any better.

Antarctica is at a risk with pollution also and it does not help all the animals on the continent. Pollution is a major problem and has to be dealt with.
