

Start here.

There are several factors that place ecosystems at risk. Most of the things are silly things that can be prevented if people just thought about what they were doing. Things such as breaking pieces of coral at the Great Barrier Reef is an example of someone doing something silly and not thinking of future generations. If people keep doing careless things people in the next generation won't be able to enjoy the beautiful reef like we have been able to. People also swim too close to aquatic life and try and grab them. This causes much stress to the animal and could cause death. People endanger wildlife by leaving rubbish laying around which washes into the water and could potentially suffocate the fish, or any animal.

~~Also~~ Not only has the GBR ~~been~~ been put at risk but also the Daintree rain forest. People also do silly things there which is ruining it. People walk past and break plants

Or pull off leaves, this is harming the plants, people also leave a lot of rubbish laying around. There are bins provided in most places so use them. If there's not take the rubbish home with you. This is evident on page 3 of the stimulus booklet in Source E, just how much rubbish gets left behind. In Source C it shows that people haven't been staying to the designated pathway. If people walk all over the ground, every day it is going to get compacted, as shown in the picture, where as if there was signs which clearly stated STAY TO THE PATH, it may remind people.
