

Question 22.

a) One ~~advantage~~ advantage of the computerised information system compared to medical practices that use paper-based records is that you can change the information and keep updating.

And the disadvantage is that information/records may get lost. With a computer it is stored.

b) The storage and retrieval, and display of ~~images~~ images in the information system is a lot easier for the user. Storage of images in the information system can be collected of the internet and stored on computer and when you need it again you can retrieve the image so it can be then displayed as that image you saved to your information system.

c) The receptionist and doctors would have different views of the data because the receptionist only needs to know the basics of the patient, such as what time, which doctor they are seeing, and their names, and contact numbers. With doctors, they have more

personal records such as test results, and diagnosis, which the records are between that doctor and that patient, which receptionist do not need to know. The doctors screen in more in depth, as it is personal records of the certain patient, which is why they have different views of data.
