15. c) The impact on which technology may have on work and leisure in the future is that we may have computers to carry out a lot of our jobs, e.g. cleaning the house, waiting for us, ~~building~~ and machine-building, equipment.

This would impact upon the workforce by not offering as many jobs as were offered in the past, which would lead to higher unemployment rates, and people with lower education would find it harder to find jobs.

Technology would impact on leisure by the fact that we wouldn't have to interact with people in real life, but through cyber worlds. Technology would also mean that our leisure periods could become longer.

Through technology, work in the future may not even be needed because of the way things are being done these days and that technology is advancing so much that less and less people are needed in construction and putting-together of good items. Machines are taking over most of these jobs.
