C.

The impact that technology may have on work and leisure in the future will be global but is already an occurrence that is happening.

Technology in the future will influence everybody in the way that they participate in work and leisure. Technology will have positive and negative impact on society, job loss, introduction of new ways to participate in work and leisure.

Technology will change the future of work and leisure in different ways the impact will be both positive and negative on society. There will be the introduction of new ways to participate in work, this is already happening now with the introduction of I-phones and I-pads that are hand held devices that enable you to complete work on the go and also receive emails and make calls to clients. The technology of web cameras and video prompts will make it easy for individuals to communicate with each other from different parts of the world, business will be able to be done face-to-face through camera links.

Technology will have the impact on work that it will create job loss among businesses. Via technology, new and improved machinery will be invented that is able to do the job that many workers do now. The impact that will have on the economy will be disastrous but on the company it will mean less money spent on training and other things but more money spent on the fixing of this machinery if it was to break or have a malfunction.

Technology will have an impact on ~~the~~ leisure via things that are already taking place, through the introduction of workouts such as Zumba that encourage working out on part of your leisure. Nintendo Wii, I-pod, I-pod, I-phones, 3D Televisions and Xbox will all expand and rival competition will come in impacting on the way that leisure is undertaken.

The impact that technology will have on leisure in society on a whole ~~unambiguously~~ in the future will be that people will become less interactive, leisure will consist on passive activities that do not bring people together. Technology will have a negative impact via leisure through people not experiencing the outdoors and always being confined indoors.

The negative impact that technology will have on work in our society in the future will be that face to face communication will be lost, jobs will be lost to make way for machinery and the way work ~~has~~ ^{will} become will promote laziness and since work will be undertaken on the go more and more people in society will not have enough time to associate in leisure activities.

The impact that technology may have on work and leisure will be global in the future it will have both positive and negative repercussions on everybody in society but may end up being a step in the right direction.
