B) Waste:

• An automotive business must ensure that waste is thrown out appropriately whether it be because it is hazardous ~~to~~ to the environment or people.

i.e Tyres are made of material that is not very biodegradable and can be harmful to the environment so they must be disposed of through companies designed to dispose of them in an environmentally friendly way.

Hazardous Materials:

- Hazardous materials can both endanger to us and the earth so Automotive workshops must dispose of them through many methods.
- banded areas where after being stored in a safe place materials are picked up by the proper business.
- containers. Containers hold materials such as oil which are not immediately hazardous but not disposed of properly can harm the environment, and ~~they~~ ^{it} ~~is~~ ^{is} stand till a relevant company comes and picks it up for disposal.
- ~~the~~ air quality:
air quality must be maintained for the safety of workers and anyone involved. For example when running a car there can be a dangerous build up of carbon monoxide which can lead to fatal ~~near~~ occurrences so proper ventilation must be used at all times. Some with handling different chemicals some can be harmful if breathed in so they must be met with the proper precautions.
