

Start here.

a) First you need to ~~make~~ ensure that there is enough efficient space to work.

Then you need to mark out on the steel where you want to drill the holes by using a ruler, ~~a~~ scriber and an engineers square you will then need to double check your markings to ensure they match up with your planned bracket.

Then you will need to place the board on the drilling board and drill the holes where ~~you~~ its marked.

You will then need to cut the steel so it can be 100mm instead of 300mm.

Once you have done that you will need to just smooth out the edges so there is no sharp edges.
